

The context

Mozambique

Houses and shelters have been damaged or destroyed.

20,000 people displaced.

Health centres damaged; risk of water-borne diseases.

Increasing risk of COVID-19 transmission.

Cyclone Eloise hit Mozambique on 23 January damaging homes and causing significant flooding. More than 260,000 people are estimated to be affected. This number is expected to rise as damaged roads and bridges are making it hard to reach affected areas. Families living in resettlement sites were hardest hit. Critical infrastructure is damaged including latrines, water points, schools and health centres. This storm struck the same areas that are still recovering from the impact of Cyclone Idai in 2019.
